

HOW COMMUNITIES CAN STOP DESTRUCTIVE DEVELOPMENT PROJECTS IN SAUDI ARABIA

Complete Community Opposition How-To

INTRODUCTION & FRAMEWORK

Concern for the environment in Saudi Arabia turns on a distinctive tension: this is a wealthy, closed kingdom, the world's largest oil exporter, undertaking some of the largest development projects the world has ever seen — vast flagship "giga-projects" marketed as models of sustainability — even as it pledges to plant ten billion trees and reach net zero, and even as those projects reshape deserts and coasts and, in at least one case, displaced the people who lived there. That tension — between the flagship developments and their green branding, between the oil economy and the green pledges, between the image projected to the world and the reality on the ground — is the distinctive ground of environmental effort here, because it is precisely the state's image-consciousness, its own stated green commitments, and the international attention its projects invite that offer the levers, in a country where open activism is dangerous. Saudi Arabia is a large, arid, closed absolute monarchy of desert and Red Sea coast. Saudi Arabia is a large, arid, and closed absolute monarchy of vast desert and long Red Sea coast, whose economy rests on oil, whose water comes overwhelmingly from the world's largest desalination effort, and whose Vision 2030 is remaking the country through enormous state-flagship projects. This guide will be honest that the giga-projects are top-down and state-driven, so they cannot be openly opposed but must be scrutinised and held to their own claims; that oil is the economy's foundation, so the footprint is central; that desalination is essential to a nation almost without fresh water; that the green initiative is real but set against a vast footprint; that the political space is closed and repressive, and that those who resisted a flagship project's displacement have met severe punishment, so the work must run through international, technical, and protective channels and shield anyone inside; and that no landmark victory is to be won; but it will show that the levers here — the giga-projects, the footprint, the water, the coast, and the green claims — are real, and, resting on the state's own commitments and its image-consciousness, can be used, with care.

The Saudi story teaches two things about opposing destructive projects here, and this guide states both plainly. The first is the pattern that runs through every guide: not a single silver bullet, but the combination of every lever pressed together. The second is distinctly Saudi, and it is what gives this guide its particular force. **Because the giga-projects are marketed to the world as green and can be held to that promise, because the oil footprint invites international climate scrutiny, because the desalination and water can be pressed toward efficiency, because the Red Sea coral is a world treasure the state itself claims to protect, and because the green initiative sets commitments the state can be held to, the levers run through accountability and image: the giga-projects, the footprint, the water, the coast, and the green claims.** That combination — the giga-projects, the footprint, the water, the coast, and the green claims — is the distinctive lever here, and this guide is built around it, because in a wealthy, closed, image-conscious monarchy, the strongest ground is holding the state to its own green promises and scrutinising its flagship projects through the international attention they invite.

But the same story carries honest qualifications this guide states plainly and takes seriously. **The projects are top-down, oil is central, desalination essential, the green paradox real, and the space closed and dangerous.** The giga-projects are state-flagship and cannot be openly opposed, only scrutinised and held to account; oil is the economy's foundation; desalination is essential to survival in a nearly waterless land; the green initiative, real as it is, sits against a vast oil economy and footprint; the political space is closed and

repressive and those who resisted displacement met severe punishment, so the work must be international, technical, reputational, within-system, and protective of anyone inside; and no landmark victory is to be pointed to. This guide does not pretend the projects can be openly opposed, or that oil is not central, or that the space is open. What it shows is how, through the giga-projects, the footprint, the water, the coast, and the green claims, those who care — in the international community, in the scientific and technical world, and, with the utmost care, anyone inside — can scrutinise the projects and press the footprint, the water, and the coast, and hold the state to its own green promises, carefully, and protecting everyone.

Most people who care about Saudi Arabia's environment do not know HOW to use the levers a wealthy, closed, image-conscious kingdom offers. They see the giga-projects rising, the flares burning, the brine pouring into the sea, the desert reshaped — and either accept the flagship projects as unchallengeable, or despair of a closed monarchy, and rarely grasp the levers that work: the state's own green claims, the international attention its projects invite, the technical scrutiny of the footprint and the water, the world treasure of the Red Sea coral. The gap between the coast defended and the coast lost is here often a gap of method — the method of using the giga-projects, the footprint, the water, the coast, and the green claims together, carefully.

This guide shows what can actually be tried — inside the Saudi reality as it is, which is a wealthy, closed, image-conscious absolute monarchy remaking itself through flagship projects marketed as green. It is written for the person — in the international community, in the scientific and technical world, or, with the utmost care, inside the Kingdom — who sees the giga-projects and the footprint and the coast and wants to know what can be done in a closed and image-conscious nation. The answer is a qualified yes: the levers are real — the giga-projects, the footprint, the water, the coast, and the green claims — with the honest qualifiers that the projects are top-down, oil central, desalination essential, the green paradox real, and the space closed and dangerous, so the work is international, technical, reputational, within-system, and protective, not open opposition. A note on who this guide is for, and on the spirit in which it should be used, because the Saudi case is particular and demands both scientific rigour and great care. It is for the person — in the international community, in the scientific and technical world, or, with the utmost care, inside the Kingdom — willing to do the patient, technical, and protective work of testing the green promises and defending the coast and pressing the footprint through science and the world's attention, rather than either accepting the flagship projects as beyond challenge or attempting the open opposition that a closed and dangerous state forecloses. That is not a lesser ambition but, in Saudi Arabia's conditions, the effective and the responsible one, because here the levers that genuinely deliver are the state's own green claims, the world's coral, the international attention, and the science of the reality, all of which are reached through the technical, scientific, and reputational channels, kept strictly environmental and protective of anyone inside. Anyone who approaches Saudi Arabia by treating the giga-projects as unchallengeable will miss the real leverage the green promises and the world's attention afford; anyone who approaches it through the science, the state's own claims, and the international attention, carefully and protectively, can genuinely help hold a great and image-conscious kingdom to the green future it has promised the world. This guide is an honest map of that careful, scientific, protective path.

The Strategic Framework

Effective efforts follow the same underlying pattern, adapted to a wealthy, closed, image-conscious kingdom:

STEP 1: TARGET IDENTIFICATION	(find the project, the claim, and the framework)
STEP 2: DOCUMENTATION	(build the evidence -- the impact and the green claim)
STEP 3: LOCAL OPPOSITION	(build the international, technical, and scientific coalition)

These steps operate **simultaneously, not in sequence**. The evidence of the impact and the green claim feeds the giga-project scrutiny, the footprint accountability, and the coastal defence at once; the international and technical coalition organises; a green-claim challenge, a technical critique, or a coral appeal is both pressure and a spur to the next. The effort that runs all five together, each reinforcing the others, gives itself the best — if still constrained — chance of scrutinising the projects and pressing the footprint, the water, and the coast.

The Levers That Are Distinctly Strong Here

Every country's system has its own pressure points. Saudi Arabia's — a wealthy, closed, image-conscious kingdom — give a distinctive set:

- **The giga-projects.** The **flagship developments, marketed as green**, can be held to that promise and scrutinised — the distinctive lever.
- **The footprint.** The **oil-superpower status and the footprint** invite international climate scrutiny.
- **The water.** The **world's largest desalination effort** can be pressed toward efficiency and lower marine harm.
- **The coast.** The **globally significant Red Sea coral** is a treasure the state itself claims to protect.
- **The green claims.** The **Saudi Green Initiative and the net-zero pledge** set commitments the state can be held to.

What This Guide Will Not Pretend

It would be dishonest to promise these levers prevail, or that the projects can be openly opposed, or that oil is not central. The projects are **top-down**; oil is **central**; desalination is **essential**; the green paradox is **real**; and the space is **closed and dangerous**. This guide takes those limits seriously — it states them plainly, and it works through accountability, image, and the international while protecting anyone inside — and shows how to use the real tools this situation offers — the giga-projects, the footprint, the water, the coast, and the green claims — to scrutinise the projects and press the footprint, the water, and the coast, honestly acknowledging the top-down projects, the central oil, the essential desalination, the green paradox, and the closed and dangerous space.

HOW THE SYSTEM WORKS

You cannot pull a lever you cannot see — and here you must see that the levers run through the state's own green claims, its image-consciousness, the international attention its projects invite, and the technical scrutiny of its footprint and its water, because in a closed and repressive kingdom open opposition is dangerous, but a state that markets its flagship projects as green and pledges net zero has given the world a standard to hold it to. Before you spend a single week, map who actually decides a project's fate, at which level, and where the leverage is real. And map where the giga-projects, the footprint, the water, the coast, and the green claims apply, because in Saudi Arabia a destructive project is met not by open protest, which is perilous, but by scrutinising the projects against their own promises, pressing the footprint and the water technically, and defending the coast through the world's frameworks.

The Levels of Decision

A Saudi project runs through a centralised, state-flagship, and image-conscious system.

The state and the sovereign fund. The **government, the ministries, and the sovereign wealth fund** decide and drive the flagship projects, and are answerable, through their own commitments, to the standards they profess.

The environment and green bodies. The **environment ministry, the green initiative, and the net-zero commitments** are the state's own stated framework — a real, if aspirational, lever.

The project developers. The **giga-project companies and their partners** build and market the projects, and are sensitive to the green image they project to the world.

The scientific and technical institutions. The **universities and research institutions**, some world-class, study the footprint, the water, and the coral, within the permitted space.

The international and reputational frameworks. The **international climate, marine, and heritage frameworks, the global investors and partners, and the world's attention** carry the standards and the scrutiny an image-conscious state feels.

The Journey of a Project

A Saudi project — a giga-development reshaping a desert or coast, a flare, a brine discharge, a coastal build near the reef — is met through the **giga-projects, the footprint, the water, the coast, and the green claims**. The **giga-projects and the green claims are where the flagship developments are best scrutinised, and the footprint, the water, and the coast are where the harms are pressed** — and using them together, through accountability and image, is the distinctive Saudi approach. The distinctive levers are the **giga-projects, the footprint, the water, the coast, and the green claims**. Find out exactly where the project stands, and, crucially, **what desert, coast, water, or reef it harms, what green claim it makes, and how the international attention, the technical scrutiny, and the state's own commitments can be brought to bear**, because those are where a project can genuinely be met.

Follow the Project, the Claim, and the Image

Behind a project stand the state, the sovereign fund, the developers, and the desert, coast, water, and reef at stake. Trace who decides, who benefits, what is harmed, and — importantly here — **what desert, coast, water, or reef is threatened, what green or sustainability claim the project makes, what framework or commitment applies, and how the international, technical, and reputational channels can act**. Two questions unlock most Saudi efforts: **What is harmed, and does the project's green claim match the reality?** and **Which lever — the giga-projects, the footprint, the water, the coast, the green claims — can meet it?** The giga-projects, the green claims, and the international scrutiny are, together, the heart of most such efforts here. Everything else in a Saudi effort ultimately serves these: the documentation exists to establish the harm and the gap with the green claim on the scientific and satellite record; the international-and-technical coalition exists to press that gap through the scientists, the frameworks, and the reputational attention; and the international media exists to reach the world — the very audience the green marketing addresses — with the measured reality behind the promise. Keep the giga-projects, the green claims, and the international scrutiny at the centre of every case, appeal, and story, and the effort retains a clear spine that runs from a single threatened reef or a single reshaped desert to the flagship promise the state made to the world, grounding the whole in the state's own claims, the science, and the international attention through which a wealthy, closed, image-conscious kingdom is genuinely reachable.

The Overseers

Finally, know the bodies and forces that shape a project, because they are the levers. The **state and the sovereign fund**; the **environment and green bodies**; the **project developers**; the **scientific and technical institutions**; and the **international and reputational frameworks**. In Saudi Arabia, the **giga-projects, the footprint, the water, the coast, and the green claims** are the most distinctive levers. Each is a separate front, and a giga-development harming a desert or coast, a flare, a brine discharge, or a coastal build near the reef can genuinely be met — through the green-claim scrutiny, the technical critique, and the international attention — though, honestly, the projects are top-down, oil central, desalination essential, the green paradox real, and the space closed and dangerous, and this guide will keep saying so, and keep working through accountability, image, and the international, protecting anyone inside.

QUICK REFERENCE: SUCCESS RATES

Before you commit effort, calibrate honestly — and here that means acknowledging the top-down projects and the closed, dangerous space, even as the state's own green claims, its image-consciousness, and the international attention give real, if constrained, leverage. These figures are **directional, not guarantees** — patterns drawn from how environmental efforts tend to go for wealthy, closed, image-conscious states, not a controlled study. The decisive variables are whether the harm can be **tied to a green claim, the footprint, or the world treasure of the coral**, whether the **international and technical avenues** can be engaged, and whether the **state's own commitments and image** can be brought to bear. Where the harm is documented and the green claim engaged, the levers here are real; but temper every figure with the honest knowledge that the projects are top-down, oil central, and the space closed and dangerous.

Individual Step Success Rates

Approach	Success Rate	Timeline	Cost	What "Success" Means
Documentation only	15–25%	weeks	low	Basis for every other step
Giga-project / green-claim	30–50%	months–years	low	The project scrutinised, held to its promise
Footprint / climate	25–45%	years	low	The oil footprint pressed through climate frameworks
Desalination / water	30–50%	years	low–moderate	The water pressed toward efficiency, lower harm
Red Sea / coral	35–55%	months–years	low	The coral defended, the coastal build scrutinised
Green-claims accountability	35–55%	months–years	low	The state held to its own green commitments
International / reputational	35–55%	months–years	low	The world's attention and standards engaged
All levers together	30–50%	years	moderate	Projects scrutinised; footprint, water, coast pressed

Key insight: every step together beats any single one, and Saudi Arabia's real leverage is its own green claims and its image-consciousness: the **giga-projects**, the **footprint**, the **water**, the **coast**, and the **green claims**. Its constraints are specific and honest: the projects are **top-down**, oil **central**, desalination

essential, the green paradox **real**, and the space **closed and dangerous** — so progress comes through accountability, image, and the international, protecting anyone inside, not through open opposition.

*A note on cost and risk: most levers here — a green-claim challenge, a technical critique, a coral appeal — are carried by international bodies, scientists, and the world's attention, so the cost falls largely on them, not on those inside. But the risk to anyone inside is real and severe: open activism is dangerous, and those who resisted a flagship project's displacement met harsh punishment, so the safety of anyone inside must come absolutely first, and the work must run from outside and through those who can act safely. The scarce resources are **the international and scientific connections, the reputational leverage, and careful documentation** — much of it reachable through the international climate, marine, and heritage frameworks, the world's scientists, and the global attention the projects invite. This shapes where a Saudi effort should concentrate its energy. Because the decisive resources are scientific and technical credibility, connection to the international frameworks and the world's attention, and the reputational leverage the image-conscious projects afford — rather than the mass mobilisation that other struggles rely on and that here is foreclosed and perilous — an effort's most valuable investments are in building the scientific record, gathering the measurable evidence of the gap, cultivating the international and reputational relationships, and grounding the whole in the state's own green claims while protecting anyone inside. A small, credible, well-connected effort that can marshal the marine and footprint science, document the gap between the promise and the reality, enlist the international attention, and keep strictly to the environmental can achieve real scrutiny and restraint in an image-conscious state, and can do so safely. The resources that matter most are thus largely a matter of scientific credibility, international connection, and reputational leverage — much of it reachable through the international climate, marine, and heritage frameworks, the world's scientists, and the global attention the flagship projects invite.*

Effectiveness Visualization

How to read this honestly. The levers that most change outcomes in Saudi Arabia are **the Red Sea coral defence, the green-claims accountability, the international and reputational engagement, and the giga-project scrutiny** — used together, with the water and footprint pressure alongside. The coral, green-claim, and reputational levers show the ceiling: a world-treasured reef defended, the state held to its own green promises, and its image-consciousness engaged can achieve real scrutiny and restraint. The top-down projects and the closed, dangerous space show the honest floor: open opposition is perilous and the projects state-flagship. Most Saudi efforts will sit between, and the honest lesson is that the levers here are real — able to scrutinise the projects, defend the coast, and press the footprint and water — but that open opposition is foreclosed and dangerous, and the surest result is that the harm is documented and pressed through the green claims, the technical scrutiny, and the international attention.

Step Importance Ranking (When All Combined)

1. **The green-claims accountability and the giga-project scrutiny** — Saudi Arabia's distinctive levers; the state's own promises and its flagship projects.
2. **The Red Sea coral and the international attention** — the world treasure and the image-conscious state's sensitivity.
3. **The water and desalination** — the efficiency and marine harm pressed.
4. **The footprint and climate** — the oil-superpower's footprint scrutinised.
5. **The documented harm and green claim** — the evidence that grounds it all.

What These Campaigns Actually Show

A few honest patterns recur. **The projects are marketed as green** — a promise the state can be held to. **The state is image-conscious** — sensitive to international scrutiny. **The Red Sea coral is a world treasure** — which the state itself claims to protect. **The green initiative sets commitments** — that can be held to account. **But the projects are top-down and the space closed** — so the work is accountability, image, and the international. The through-line: **document the harm and the green claim; scrutinise the giga-projects against their own promises; press the footprint through the climate frameworks; press the desalination toward efficiency; defend the Red Sea coral; hold the state to its green commitments; use the international and reputational attention; and protect anyone inside** — because an effort that does can genuinely scrutinise the projects and press the footprint, the water, and the coast, while being honest that the projects are top-down, oil central, and the space closed and dangerous.

STEP 1: TARGET IDENTIFICATION

Every effective effort begins by finding the exact project and harm — and the leverage, which here runs through the green claim, the footprint, the coral, and the international attention. Vague concern goes nowhere, and open opposition is dangerous; an effort aimed at "this project harming this desert, coast, water, or reef, whose green claim can be tested and whose harm the international, technical, or reputational levers can reach" is a real, workable effort. Answer five questions.

The Five Core Questions

1. **What is harmed?** This is the first question here. What **desert, coast, water, or reef** is harmed — the desert ecology, the Red Sea coral, the marine life, the water, the biodiversity.
2. **What green claim does it make?** What **green or sustainability claim** the project makes — "zero-carbon," "in harmony with nature," "regenerative" — that can be tested against the reality.
3. **Is it the giga-project, the water, or the coast?** Whether the matter is one of the **giga-projects and their claims**, the **footprint and water**, or the **coast and coral** — for each has its levers.
4. **What framework or commitment applies?** What **green initiative, net-zero, climate, marine, or heritage framework or commitment** the project touches.
5. **How can the international and technical channels act, safely?** How the **international bodies, the scientists, and the reputational attention** can act — carefully, protecting anyone inside.

A Worked Example

Suppose a coastal giga-development is being built near a stretch of the Red Sea's reefs, marketed as "regenerative" and "in harmony with nature," even as the construction threatens the coral and the marine life.

Working the five questions: **what is harmed? What green claim does it make? Is it the giga-project, the water, or the coast? What framework applies?** And how can the international and technical channels act, safely? The driver is the coastal build and the claim, with the coral defence, the green-claim scrutiny, and the international attention as the levers.

Within a season the effort has moved from "the giga-development is unchallengeable and nothing can be said" to a real, careful effort: document the coral and the harm; test the "regenerative" claim against the reality; defend the reef through the marine frameworks and the state's own conservation claims; and engage the world's scientists and attention — all protecting anyone inside. That is a workable effort suited to Saudi Arabia — one that holds a flagship project to its own green promise through science and international attention, carefully. Notice what the five questions accomplish, and how they suit a fight in a wealthy, closed, image-conscious kingdom: they turn what might seem an unwinnable confrontation with immense resources and centralised power — the giga-projects rising, the coasts developed, the deserts reshaped — into a set of specific, answerable questions, each attached to a lever that rests on the state's own green claims, the science, and the international attention, rather than on an open confrontation the closed space forecloses and endangers. The harm becomes a documentable impact on desert, coast, water, or reef. The claim becomes a testable promise of green. The category becomes the giga-projects, the footprint and water, or the coast and coral, each with its levers. The framework becomes the green initiative, the net-zero pledge, or the marine standard. And the channels become the international, technical, and reputational ones, kept strictly to the environment and protective of anyone inside. That translation — from a seemingly hopeless confrontation with a resource-rich, image-managed state into a set of specific accountability actions grounded in the state's own promises and the world's attention — is the first and most important thing a Saudi effort does, because it moves the fight from the despair of a closed and powerful kingdom onto the firm ground of the promise it made to the world, where careful, scientific, protective work has a genuine, if constrained, voice.

STEP 2: DOCUMENTATION — HOW TO BUILD AN UNASSAILABLE CASE

Documentation is the foundation everything else stands on — and here, distinctively, the decisive evidence is the harm and the gap between the green claim and the reality, much of it measurable by science and satellite. An environment ministry, a green initiative, the scientists, the international frameworks, and the world's attention all move on evidence — and for Saudi Arabia, a clear record of the harm and the mismatch with the green claim is precisely what an accountability effort turns into a real result, so build it well, and safely. Build your file in three layers.

Layer 1: The Project, the Harm, and the Claim

Get the facts the case turns on. Identify the **project and the harm** — the giga-development, the flare, the brine, the coastal build — and, decisively here, **the desert, coast, water, or reef it harms and the green claim it makes**: the "zero-carbon" city, the "regenerative" resort, the conservation promise, tested against the reality. Establish exactly **what the project is, what it harms, and what green claim it makes**, because the harm-against-the-claim is the case's foundation.

Layer 2: The Harm, the Science, and the Gap

Document the harm with the science. Establish the **environmental harm** — the desert ecology reshaped, the coral threatened, the brine, the footprint — and set it against the **green claim and the science** — drawing on **the marine and desert science, the satellite and footprint data, the desalination and brine studies, the state's own commitments, and the international science**. This harm-and-gap evidence turns the concern into a documented mismatch between the green claim and the reality, measurable and hard to dismiss.

Layer 3: The Case, the Framework, the Channel, and the Care

Finally, document the case and the path. Does the **harm** contradict the green claim or breach the state's own commitments, the marine, or the climate frameworks? What **framework or commitment** — green initiative, net-zero, marine, heritage, national or international — applies? Which **international bodies, scientists, or reputational channels** will act? And how will the work stay **careful, strictly environmental, and protective of anyone inside**? Each is a separate element, and together they make a case grounded in the science and the state's own claims. This is the layer that most often decides these efforts, because a documented harm, a testable green claim, an applicable commitment, and a careful, protective channel are exactly what let a Saudi effort scrutinise the projects and defend the coast. Build it well, and the giga-projects, the footprint, the water, the coast, and the green claims become the effort's genuine strength. One practical note on building this layer: because Saudi Arabia markets its flagship projects and its green commitments intensively and publicly, and because the actual impacts are measurable by science and satellite, a great deal of the necessary evidence sits, in effect, on two sides of a documented gap — the state's own published claims on one side, and the measurable reality on the other. The green promises, the net-zero pledge, the conservation showcases, and the sustainability branding are all publicly made and quotable; the reshaping of the desert, the coastal impact, the brine discharge, and the footprint are visible from satellite and measurable by science, including by world-class institutions. This means an effort here can often build its case precisely as a comparison — the promise as published against the reality as measured — which is both the most powerful form the case can take and the safest, since it rests on the state's own words and on hard scientific fact rather than on anything that could be read as political. Building this layer well therefore means gathering both sides with care — the published green claims and the measured reality — and framing the whole as the honest testing of a promise the state made to the world, so that the case stands on the solid, safe ground of the state's own commitments and the science.

WHAT TO GATHER, AND WHERE TO FIND IT

Evidence in hand beats evidence you assume exists — and here much of it lives in the marine and desert science, the satellite and footprint data, the desalination studies, and the state's own published commitments. Here is where the material tends to live in a Saudi effort, and how to get it — with the **harm**, the **green claim**, the **science**, and the **framework** at the center, and care for anyone inside throughout. Treat this as a checklist to work through, not a menu to admire.

The Project, Harm, and Claim Record

Start with the project and its green claim. **The project's own materials, the environmental impact assessments, and the state's published commitments** establish the project and its claim; the distinctive strengths here are the **state's own green and sustainability claims**, publicly made, and the **satellite record of the actual impact**, both a matter of record. Establish the **project, the harm, and the green claim it makes**, drawing on the project's materials and the satellite record. Establish exactly **what is**

planned, what it harms, and what green promise it makes, because a documented gap between the promise and the reality is strong ground.

The Harm, Science, and Gap Evidence

This is the heart of the file. Gather the **harm evidence** — the desert reshaping, the coral threat, the brine, the footprint — and the **science and the gap** — drawing on **the marine and desert science, the satellite and footprint data, the desalination and brine studies, and the international science**. This harm-and-gap evidence is what turns the concern into a documented mismatch between the green claim and the reality.

The Commitment, Framework, and Green-Claims Record

Document the levers of the frameworks and claims. Gather the record of **the Saudi Green Initiative, the net-zero commitment, and the state's own conservation and sustainability claims; the marine, coral, and coastal frameworks; and the international climate, marine, and heritage frameworks**. A community and its allies that understand the state's own green commitments and the international frameworks hold the levers that press an image-conscious state.

The Scientific, Reputational, and International Record

Document the wider levers. Gather the record of the **scientific and technical institutions, some world-class, and the international scientists; the global investors, partners, and the world's attention** on whom the projects depend for their image; and the **international frameworks and bodies**. A community and its allies joined to the world's science and the reputational and international attention hold levers that reach an image-conscious state.

The People, the Care, and the Protection

Finally, and importantly, map the human terrain and the care it requires. Who is affected — the **communities near the projects, the coastal and desert people, and the future generations** — and who can act safely: the **international bodies, the scientists, the reputational channels, and, only where safe, anyone inside**, since open dissent is dangerous. And how does the effort **stay careful, strictly environmental, and protective of anyone inside**? A Saudi effort is advanced through the giga-projects, the footprint, the water, the coast, and the green claims — so map that coalition deliberately, keep strictly to the environmental, and let the protection of anyone inside govern every step, for those who resisted a flagship project met severe punishment.

STEP 3: BUILDING LOCAL OPPOSITION

Here this step must be understood carefully, because Saudi Arabia's political space is closed and repressive, open adversarial organising is dangerous, and those who resisted a flagship project's displacement met severe punishment, so the "opposition" that works joins the international community, the scientists, and the reputational attention, pressing through accountability, image, and the state's own claims, strictly on the environment and protecting anyone inside. The task is to build a coalition — of international bodies, scientists, technical experts, and reputational actors — that scrutinises the projects and defends the coast and presses the footprint and water, carefully.

Why the International-and-Technical Coalition Is Decisive

In Saudi Arabia, the coalition that can act joins the international community and the scientists to the reputational attention the projects invite, because a closed but image-conscious state responds to international scrutiny, to the gap between its green claims and the reality, and to the world's attention more than to open dissent, which is dangerous. That coalition supplies what a careful effort runs on: the international bodies and frameworks that hold the state to its claims, the scientists whose evidence is strong and measurable, the reputational and investor attention on which the image-conscious projects depend, and, only where safe, those inside. When the scientists and the international attention press the gap between the green claim and the reality, they become a genuine force. **A coalition that is international, technical, and reputational here is not a weaker substitute for open protest; it is the safe and effective form advocacy can take in a closed and dangerous Saudi Arabia — the real foundation of an effort, pressing the projects through their own claims and the world's attention, while anyone inside is protected absolutely.** This is worth dwelling on, because the particular conditions of Saudi Arabia make this international, technical, reputational approach not a fallback but the only responsible and effective one. In an open society, an environmental effort might rest on public mobilisation and open protest; in a closed and repressive state where open activism is dangerous and those who resisted a flagship project met severe punishment, that avenue is both foreclosed and perilous, and any attempt at it risks grave harm to those who undertake it. But Saudi Arabia's situation offers a different and genuine strength: the state has marketed its flagship projects to the world as green, has pledged net zero and ten billion trees, and depends for its projects' image on international investors, partners, and attention, so that an effort pressing the gap between the green promise and the reality works precisely where the image-conscious state is most exposed. The task, therefore, is to build the coalition that acts in that international and reputational space, joined to the world's science: the international bodies and frameworks that hold the state to its claims, the scientists whose evidence measures the gap, the reputational and investor actors on whom the projects depend, and, only where entirely safe, those inside. This is not a weaker path but, in Saudi Arabia's conditions, the wiser and safer one, for it advances the defence of the coast and the scrutiny of the projects through channels that carry weight with an image-conscious state and stay clear of the dangers that would forfeit both the safety of those involved and the leverage the state's own promises provide.

Finding the Coalition

Begin with those who can act within the space and safely — the **international bodies, the scientists, the technical experts, the reputational and investor actors, and, only where safe, anyone inside** — and keep strictly to the environmental, protecting everyone. Widen to the international community that shares a concern for the coral, the footprint, and the green claims. Name the shared stake — **the world's coral, the world's climate, and the gap between the promise and the reality** — because the Red Sea coral is the world's and the green claims are made to the world. Frame the effort around the green claims, the coral, and the international attention, carefully and constructively. There is real power in framing the cause this way, because it rests the effort on the state's own promises and on a science that is measured and hard to dismiss. A campaign framed as opposition to the state or its projects would, in a closed and dangerous nation, be both foreclosed and perilous, endangering those who undertook it. A campaign framed around the gap between the green promise and the reality, the defence of a world-treasured coral the state itself claims to protect, and the honouring of the commitments the state has made casts the effort not as dissent but as the holding of the state to its own professed standards, a cause the world's scientists, investors, and attention can engage. This framing is not only the safer one; it is also the truer one, because the state genuinely has made these promises to the world, and the aim really is to see them honoured rather than to deny a nation its development. An effort that names this frame precisely — the green claims, the coral, and the international attention — stands on the firmest and safest ground the Saudi situation affords.

Coalition-Building, Through the International and Technical

A coalition allied is stronger than any single actor, and in Saudi Arabia it runs through the international, the technical, and the reputational. Reach to the **international climate, marine, and heritage bodies**; the **scientists and technical experts**; the **reputational, investor, and partner actors**; the **international attention and media**; and, only where safe, **those inside**. Frame the coalition around the giga-projects, the footprint, the water, the coast, and the green claims. Build breadth through the international, technical, and reputational routes, strictly on the environment, protecting anyone inside — for the coalition's strength is the science and the state's own green claims.

Sustaining the Effort

Saudi efforts are sustained through the international, the technical, and the reputational. Keep the coalition **informed, connected, and careful**, and anyone inside **safe**; mark real steps — a green claim tested, a coral protected, a brine reduced, a commitment held to, a project scrutinised. And keep the effort grounded in the green claims, the coral, and the science, which endure and reach an image-conscious state. The effort that lasts is the one that works through accountability and image, engages the science and the international attention, and protects anyone inside absolutely.

STEP 4: REGULATORY, DEVELOPMENT & ENVIRONMENTAL-GOVERNANCE CHALLENGES — THE GIGA-PROJECTS, THE WATER, AND THE COAST

This is where a Saudi effort is realistically advanced — not through open opposition, which is dangerous, but through the **scrutiny of the giga-projects against their green claims, the pressing of the footprint and the water, and the defence of the coast**, grounded in the science, the state's own commitments, and the international attention. Here the giga-project, water, and coast levers come together, because in Saudi Arabia a project that harms the desert or coast can be scrutinised through those levers, carefully and technically.

Setting Expectations Honestly

First, the honest truth. The levers are **real but work within a closed, image-conscious, dangerous state**. The giga-project scrutiny is **real through the green claims but the projects are state-flagship**; the footprint pressure is **legitimate but oil is central**; the water pressure is **real but desalination is essential**; the coral defence is **strong but the coast is being developed**; and the space is **closed and dangerous**. What these levers realistically achieve is **the projects scrutinised and held to their claims, the footprint pressed, the water made more efficient, the coral defended, and the commitments held to** — real outcomes, if not the halting of state-flagship projects. Enter this front clear-eyed: the giga-projects, the water, and the coast are Saudi Arabia's distinctive levers, strongest when the **harm and the gap with the green claim are clearly documented** — but the projects are top-down, oil central, and the space closed.

The Giga-Projects and the Green Claims

The first front is the flagship projects and their claims. The **giga-projects** — marketed to the world as zero-carbon, regenerative, and in harmony with nature — can be **scrutinised against those very claims**: the reality of their desert reshaping, their coastal impact, their feasibility, and the gap between the promise and the outcome, pressed through the international attention the projects court and the state's own stated standards. Use the giga-projects and the green claims, because a state that markets its flagship projects to

the world as green has handed the world a standard to hold it to, and documenting the gap between the promise and the reality is the strongest and most distinctive work here — a scrutiny an image-conscious state genuinely feels. It is worth being clear about both the power and the limits of this giga-project front, honestly, for it is the most distinctive lever a Saudi effort holds. Its power is real and distinctive: the state has staked enormous prestige and investment on marketing its flagship projects to the world as models of green urbanism and regenerative development, so that the gap between that marketing and the measured reality is a vulnerability an image-conscious state genuinely feels, and one the world's attention can press. Its limits are equally real: the projects are state-flagship, backed by immense resources and centralised power, and cannot be halted by scrutiny alone; the aim is not to stop a nation's development but to hold it to the promises it made. Understanding both means using the giga-project front for what it does best — testing the green claims against the reality, documenting the gap, and pressing it through the international attention the projects court — while recognising that scrutiny restrains and shapes rather than halts, and pairing the giga-project front with the concrete coral, water, and footprint cases that ground the promise-versus-reality contest in specific, measurable harms.

The Footprint and the Water

The second front is the footprint and the water. The **oil-superpower footprint** can be pressed through the **international climate frameworks and the state's own net-zero pledge**, and the **world's largest desalination effort**, energy-intensive and discharging brine into the sea, can be pressed toward **efficiency, renewable power, and lower marine harm**, alongside the deep water scarcity behind it. Use the footprint and the water, because the state's own net-zero pledge invites the climate scrutiny of its footprint, and the desalination — essential as it is to a nearly waterless land — can be pressed toward the efficiency and the lower brine and energy harm the state itself professes to seek. Handle the water fairly, seeking efficiency and lower harm, not the denial of water to a desert nation.

The Coast and the Coral

The third front is the Red Sea coast. The **globally significant, heat-resistant Red Sea coral**, a treasure of world science and one the state itself claims to protect and showcase, threatened by the coastal giga-developments, can be defended through the **marine frameworks, the science, and the state's own conservation claims** — holding the coastal builds to the "regenerative" promises made for them, and the coral-protection showcases to their substance. Press the coast and the coral, because the Red Sea coral is a world treasure the state has publicly pledged to protect, and holding the coastal development to that pledge, through the science and the marine frameworks, defends both the reef and the credibility of the claim. Pursued together — the giga-projects, the water, and the coast — these fronts are how a Saudi effort scrutinises the projects and presses the footprint, the water, and the coast, through accountability, image, and the international, protecting anyone inside. It is worth understanding why these fronts reinforce one another so well in Saudi Arabia's particular situation. The giga-project front tests the flagship developments against the very green claims marketed for them. The footprint-and-water front presses the oil economy and the desalination through the state's own net-zero and efficiency pledges. And the coast-and-coral front defends a world treasure the state itself professes to protect and showcase. Each covers the others' reach: the giga-projects at the level of the flagship promise, the footprint and water at the level of the pledged transition, and the coast and coral at the level of the world treasure. And each strengthens the others, for the green claims that mark the giga-projects are the same the footprint and water strain, the coral the coast front defends is the same the projects' regenerative promises invoke, and the international attention drawn by any one front reaches them all. An effort that grasps this mutual reinforcement, and pursues each front together, makes the fullest use of the several accountability, scientific, and reputational levers that a wealthy, closed,

image-conscious kingdom, having promised the world a green future, uniquely provides.

TURNING YOUR EVIDENCE INTO ARGUMENTS

Evidence does not speak for itself; you must aim it at each decider in the language that moves them. The same file of harm and green claim becomes different arguments for the state, the green bodies, the developers, the scientists, and the international frameworks. Translate deliberately, and always carefully, strictly on the environment.

For the State and Green Bodies

The state and green bodies respond to **their own commitments, their image, and the science**. Frame the harm as a gap between the project and the state's own green promises: here is the project, the harm, the green claim it breaches, the commitment it strains. Give them the documented harm and the mismatch, and press for the project to honour the claims made for it. Make it concrete: *here is your green pledge, here is the harm, here is what would honour the promise*. This is the argument an image-conscious state that made the pledge must weigh.

For the Project Developers

The developers respond to **their green image and their partners**. Frame the harm as a threat to the project's green branding and its international standing: here is the "regenerative" claim, the reality, the reputational risk. Give them the evidence and the gap, and press for the project to match its promise. A developer whose image depends on the green claim is sensitive to the gap.

For the Scientists and Technical Community

The scientists respond to **the data, the rigour, and the coral**. Frame the harm as a technical and scientific matter: here is the coral, the brine, the footprint, the measured impact, the remedy. Give them the data and the technical case, and enlist their rigour and voice. The world's marine and climate scientists, and Saudi Arabia's own world-class institutions, engaged carefully, are a genuine force.

For the International Frameworks and Public

The international frameworks and the public respond to **the world's coral and the gap between promise and reality**. Translate the file into the story of a world treasure and a green promise tested: here is the Red Sea coral and the zero-carbon claim, and the science of the reality. Frame it as the accountability of a green promise made to the world. Keep it accurate and careful, strictly on the environment; and protect anyone inside. And speak to the science and the world's attention.

The Golden Rule

Never fabricate, never exaggerate, keep strictly to the environmental, and protect anyone inside. Your credibility rests on the real harm and the real, measurable gap with the green claim — accountability and science, not the denial of a nation's development; and care and protection are essential in a closed and dangerous state where those who resisted a project met severe punishment. State the harm precisely, tie it to the green claim and the science, and press through the international, technical, and reputational channels. An effort that is precise, scientific, and grounded in the state's own claims is far harder to dismiss than one that overreaches, and far safer than one that strays into open opposition.

STEP 5: MEDIA STRATEGY

Media and attention convert your evidence into pressure — and here, for a closed but intensely image-conscious state, the international attention is the very lever, because the giga-projects and the green claims are marketed to the world, and the gap between the promise and the reality is a story the world will hear. The domestic space is closed and the risks real, so the "media" that works is the international coverage, the scientific communication, and the reputational attention, kept strictly on the environment.

Why Media Matters

The state, the green bodies, the developers, the scientists, and the world behave differently when the harm and the gap with the green claim are visible internationally. Media does three things here: it **connects the international community and the scientists to the evidence**, it **raises the stakes** for a state and projects that have staked their image on the green promise, and it **reaches the international frameworks, the investors, and the world's attention**. Because the projects are marketed to the world and the state is intensely image-conscious, the international attention is a genuine and powerful lever, and the gap between the green claim and the reality is precisely the story that reaches it. The domestic space is closed and dangerous, so the media effort runs through **international coverage, scientific communication, and careful, strictly-environmental documentation**, protecting anyone inside.

Crafting Your Narrative

Lead with the promise and the reality. The strongest frame is measured and concrete: *a flagship project marketed to the world as zero-carbon and in harmony with nature — or a coast promised as regenerative — set against the reality the science shows*. Put the green claim and the gap first, because the promise made to the world and the reality measured against it is a powerful, hard-to-dismiss story. Keep it scrupulously accurate and scientific, strictly on the environment; and protect anyone inside. The Saudi story is powerful precisely because the state has marketed its projects as green to the world, and the world can weigh the promise against the reality.

Choosing Your Channels

Match the channel to the audience. **International coverage and scientific communication** for the world and the frameworks; **the reputational and investor channels** for the projects' image; **the marine and climate science channels** for the coral and the footprint; and **careful documentation** for the record. Because the state is image-conscious and the projects internationally marketed, the international and reputational channels matter most, kept careful and strictly environmental — the green promise and the world's coral are the story's power.

A Few Cautions

Stay accurate, scientific, careful, and strictly environmental — the aim is scrutiny and accountability and the defence of the coast, not confrontation, and never anything that could be read as political or that could endanger anyone. Frame the story around the green claims, the coral, the footprint, and the water, and observe the real dangers of a closed state, keeping entirely to the environmental and protecting anyone inside. Handle the state, the politics, the human-rights matters, and the geopolitics factually and minimally, keeping the focus on the environment. And sustain the story across the slow work. Above all, let the green promise, the world's coral, and the science carry the story, because that is where a Saudi effort is strongest and safest.

EMAILS & LETTERS: TEMPLATES THAT WORK

Templates save time and prevent mistakes, but adapt every one — insert the real project, the real green claim, keep it factual and strictly environmental, and protect anyone inside. Here the green claims, the science, and the international attention win.

8A: Requesting Information

Subject: Request for information — [project] and its environmental impact

To [environment ministry / project authority],

I am writing regarding [the project] and its effects on [the desert / coast / water / reef]. In support of the environmental commitments the project professes, I respectfully request the **environmental impact assessment**, the **marine and desert studies**, and the **monitoring records** for the project, that its impact may be understood and managed.

I would be grateful for a response by [date].

Respectfully,

[Name, contact]

8B: The Green-Claim Scrutiny

Subject: [Project] and its sustainability claims

To [green initiative / project developer],

The [project] is presented as [zero-carbon / regenerative / in harmony with nature], yet [the harm] appears to depart from that promise. I respectfully urge that the project be brought into line with the green commitments made for it, and that the gap be addressed. I attach the science.

Respectfully,

[Name, contact]

8C: The Footprint / Climate Case

Subject: [Project / the footprint] and the net-zero commitment

To [environment ministry / green initiative],

Our nation has pledged net zero and a green future. The [project / flare / footprint] appears to strain that pledge. I respectfully urge that it be reconsidered in light of the net-zero commitment, and the footprint reduced. I attach the footprint data.

Respectfully,

[Name, contact]

8D: The Desalination / Water Case

Subject: Desalination efficiency and brine at [location]

To [water authority / environment ministry],

The desalination at [location] is energy-intensive and discharges brine into the sea. I respectfully urge greater efficiency, renewable power, and reduced brine harm, in keeping with the water and marine commitments professed. I attach the desalination and marine data.

Respectfully,

[Name, contact]

8E: The Coral / Coast Case

Subject: Protecting the Red Sea coral at [location]

To [environment ministry / marine authority],

The globally significant Red Sea coral at [location] is threatened by [the coastal development], despite the conservation the project professes. I respectfully urge its protection through the marine frameworks and the state's own coral-conservation commitments. I attach the marine science.

Respectfully,

[Name, contact]

8F: To an International Framework or Body

Subject: The Red Sea coral and a green claim tested in Saudi Arabia

Dear [international / marine / climate body],

We write regarding [the threat to the Red Sea coral / the gap between a project's green claim and its reality]. We respectfully seek your scientific engagement and, for the coral, the marine and heritage frameworks' attention, in keeping with the standards and science shared. We provide the documentation.

Respectfully,

[Name, contact]

8G: Scientific / Documentation Pitch

Subject: A green promise and the reality, measured

Dear [scientist / journal / editor],

A flagship project marketed to the world as green, and one of the world's great coral reefs, offer a rigorous, important scientific story: the promise measured against the reality. We can provide the marine and footprint data, the satellite record, and the technical case, kept strictly to the science and the environment.

Sincerely,

[Name, contact]

8H: Rallying the Community

Subject: The world's coral, and a promise tested

Dear neighbours and friends,

Our coast holds one of the world's great coral reefs, and our nation has promised the world a green future — and the reality can be measured against the promise. Together — communities, scientists, and all who

share the coast and the concern — by documenting the harm, testing the green claims, and defending the coral, we can hold the promise to account, carefully and on the science. Please join us, keeping to the environment and to each other's safety: share what you know, and add your voice.

With respect,

[Name]

IF YOU HAVE LITTLE TIME: THE RAPID-FIRE VERSION

Sometimes a harm is acute — a coastal build reaching a reef, a giga-project phase breaking ground, a brine discharge, a flare — and you cannot run the full effort. Triage to the levers that work fastest here, which means the green-claim scrutiny, the coral defence, and the international attention, kept strictly environmental and protecting anyone inside.

The First 48 Hours

Establish the essentials: **what is harmed, and does the project's green claim match the reality**. Identify the immediate harm — a **coastal build, a project phase, a brine discharge, a flare** — because that is what you must affect first. Reach the **international bodies, the scientists, and the reputational channels** at once, because in Saudi Arabia the green-claim scrutiny, the coral defence, and the international attention are the fastest routes to real leverage — and keep strictly to the environmental and protect anyone inside from the start.

The Fastest-Moving Levers

Some levers work faster than others. **The green-claim scrutiny** can be made at once, testing the promise against the reality. **The coral defence** can be raised quickly for a threatened reef. **The international attention** can be engaged fast for an image-conscious project. **The scientists** can mobilise quickly. These outpace the slower work of the deep footprint and water reform — which must follow — because the green-claim scrutiny, the coral, and the international attention can be brought to bear immediately. Above all, if a project's green claim departs sharply from the reality, document and press that gap fast, because an image-conscious state and its projects are most reachable through the promise they made to the world.

Emergency Coalition-Building

You cannot build a full coalition overnight, but here you can reach the scientists and the international attention fast, carefully. Reach immediately to the **international bodies, the scientists, and the reputational and media channels**, keeping strictly to the environmental and protecting anyone inside. A coalition testing the green claim, defending the coral, and engaging the international attention is the most a rapid Saudi effort can do. Speed favours the prepared: know the harm, the green claim, and the international channels before the crisis breaks, and work carefully and protectively.

WHEN THE SYSTEM IS TILTED

Here, honestly, the field is tilted less by lawlessness than by the immense resources and centralised power behind the state-flagship projects, by an economy founded on oil, by a closed and repressive space where open activism is dangerous, and by a sophisticated management of image that markets even reshaped deserts and developed coasts as green. Name it plainly, because pretending the projects are not state-flagship, or that the space is open, or that the green marketing is the whole truth, would be false — but

the state's own green claims, its intense image-consciousness, and the world's attention make even this tilted field one where careful, accountability-based work can move.

Recognising a Tilted Field

The signs are specific and honest. **The projects are state-flagship** — backed by immense resources and centralised power. **The economy rests on oil** — the footprint is foundational. **The space is closed and dangerous** — open activism is perilous. **And the image is managed** — harm is marketed as green. But **the state's own green claims, its image-consciousness, and the world's attention** are real levers. This is a tilt of immense resources, a central economy, a closed space, and a managed image, worked through the green claims, the science, the coral, and the international attention, kept strictly environmental.

Strategies for a Tilted Field

When the field is tilted, use the levers of accountability, science, and image. Lean on the **state's own green claims**, which give a standard to hold it to; the **science**, which measures the gap; the **Red Sea coral**, a world treasure the state itself professes to protect; the **international attention**, which the image-conscious projects court; and the **reputational and investor pressure**, on which the projects depend. Meet the flagship projects not with open opposition but with the documented gap between their promise and their reality. And build the science and the international relationships over time, because for an image-conscious state these accumulate into real pressure. A field tilted by resources and a managed image is worked through the state's own claims, the science, and the world's attention, carefully and protectively, not through an open opposition the closed space makes dangerous.

The Honest Possibility of Losing

You may achieve little visible change — the giga-project may rise, the coast may be developed, the flares may burn — and this guide will not pretend otherwise; the resources are immense and the state closed. But here the work is rarely wholly wasted: **the harm was documented, the green claim tested, the coral defended, the footprint pressed, and the world engaged** — and every green claim held to account, every coral protected, every brine reduced, every commitment pressed makes a real difference and builds the scrutiny an image-conscious state cannot forever ignore. Press, carefully and scientifically, for accountability and the defence of the coast; even if a project proceeds, the gap you documented between the promise and the reality will shape the next, because a state that has staked its image on a green promise cannot forever ignore the world's measure of it.

WHEN IT'S NOT CORRUPTION BUT GREENWASHING

In Saudi Arabia, the distinctive challenge is often not corruption in the ordinary sense but greenwashing: the marketing of environmentally significant projects — reshaped deserts, developed coasts, an oil economy — as green, sustainable, and "in harmony with nature," so that the image outpaces the reality. The harm here is partly the gap between the green promise made to the world and what is actually done, and the way that promise can obscure the impact. This calls for the honest, scientific testing of the claims against the reality, kept strictly environmental and protective of anyone inside.

Telling Greenwashing from Genuine Green

Here the task is to distinguish a genuine environmental gain — a real coral-restoration, a real renewable project, a real efficiency — from the marketing of harm as green. The marks of greenwashing are specific: **a project marketed as green whose actual impact departs sharply from the claim, conservation**

showcases that distract from larger harms, green pledges set against a continuing and vast footprint, and the promise outpacing the substance. Be rigorous and fair: **distinguish the genuine green gains, which are real and should be credited, from the marketing of harm as green**, relying on the science, the satellite record, and the state's own commitments, and keeping strictly to the environmental. And credit what is genuine — the real renewables, the real restoration — for fairness and credibility both require acknowledging the true alongside testing the claimed.

Responding to Greenwashing — Through Science and Accountability

Where greenwashing is real, the response runs through the science and the state's own claims. Use the **green claims and commitments** to hold the state and projects to the standard they professed. Use the **science and the satellite record** to measure the gap between the promise and the reality. Use the **international attention** to make the gap visible to the world the marketing addresses. And use the **reputational and investor channels** on which the green image depends. Document rigorously, credit the genuine, keep strictly to the environmental, and protect anyone inside. Route the effort through the science, the claims, and the international attention — never through confrontation or the political.

A Note on Safety and Protection

This note matters greatly here. Saudi Arabia is a closed and repressive state where open activism is dangerous, and those who resisted a flagship project's displacement met severe punishment, so this work must be done with great care and kept strictly to the environmental. Favour the **international, scientific, reputational, and technical channels** over any open confrontation; protect anyone inside absolutely, and be mindful that dissent framed as political is met harshly; frame the work only around the green claims, the coral, the footprint, and the water, never around anything political; and handle the state, the human-rights matters, and the geopolitics factually and minimally. Care and protection here are not optional but essential: the path in Saudi Arabia runs through the science, the state's own green claims, and the world's attention, kept strictly environmental and protective, and nothing — no documentation, no case, no appeal — is worth endangering a single person in a state where resistance has met severe punishment.

INTEGRATION & TIMELINE: RUNNING ALL FIVE STEPS TOGETHER

The steps in this guide are written in sequence but run in parallel, each feeding the others — all through the green claims, the science, and the international attention, carefully and protectively. Here is how they fit into a single Saudi effort.

The Parallel Effort

From the start, the five run together. **Documentation** builds the harm-and-green-claim file. **Target identification** aims it at the levers. **Local opposition**, understood as the international-and-technical coalition, organises the scientists, the bodies, and the reputational actors. **Regulatory, development, and environmental-governance** work scrutinises the projects, presses the footprint and water, and defends the coast. **Media**, international and careful, carries the accountability-and-image cause. The harm-and-green-claim feeds all five at once — a documented gap is a green-claim challenge, a technical critique, a coral appeal, and an international story together. Run in parallel, they compound; run one at a time, they stall — and here, through accountability and image, they compound into real scrutiny and defence.

A Rough Timeline

Early (weeks 1–8): establish the harm and the gap with the green claim; identify the giga-projects, the footprint, the water, and the coast; build the international-and-technical coalition and begin documentation, protecting anyone inside. **Middle (months 2–18):** scrutinise the projects against their claims; press the footprint and water; defend the coral; and hold the commitments to account. **Later (months and years):** see the projects scrutinised, the coral defended, the water made more efficient, and the commitments pressed. A Saudi effort works through accountability, science, and the international attention, and its fruits — projects scrutinised, coast defended — are gradual; pace it accordingly, keep strictly environmental, and let the protection of anyone inside govern every step.

The Core Discipline

Through it all, hold the discipline that gives these efforts their force: **document the harm and the green claim; scrutinise the giga-projects against their own promises; press the footprint through the climate frameworks; press the desalination toward efficiency; defend the Red Sea coral; hold the state to its green commitments; use the international and reputational attention; and protect anyone inside.** The coalition that presses all five, through the green claims, the science, and the world's attention, and protects anyone inside, is the one that can genuinely scrutinise the projects and press the footprint, the water, and the coast — the kind of result a wealthy, closed, image-conscious kingdom allows.

FINAL ASSESSMENT

Opposing a destructive project in Saudi Arabia is genuinely challenging, and bound up with immense state resources, with an economy founded on oil, with a closed and repressive space where open activism is dangerous, and with a sophisticated marketing of harm as green, and this guide has been honest about that from its first line: the projects are top-down, oil central, desalination essential, the green paradox real, and the space closed and dangerous. And yet the effort is far from futile, because the giga-projects are marketed to the world as green and can be held to that promise, because the oil footprint invites international climate scrutiny, because the desalination and water can be pressed toward efficiency, because the Red Sea coral is a world treasure the state itself claims to protect, and because the green initiative sets commitments the state can be held to — and those levers of the giga-projects, the footprint, the water, the coast, and the green claims are real.

Some honest truths hold across every effort here. **The state markets its projects as green — and precisely because it does, it can be held to that promise. The Red Sea coral is a world treasure the state itself claims to protect. The green commitments set standards that can be pressed. But the projects are top-down, oil central, and open activism dangerous.** Hold both truths at once: real, distinctive levers of accountability and image, and the honest weight of a closed, resource-rich, image-managed state.

Above all, keep the discipline — and the protection — that give these efforts their force. Document the harm and the green claim. Scrutinise the giga-projects against their own promises. Press the footprint through the climate frameworks. Press the desalination toward efficiency. Defend the Red Sea coral. Hold the state to its green commitments. Use the international and reputational attention. And protect anyone inside — because in a wealthy, closed, image-conscious kingdom, an effort that scrutinises the projects and defends the coast through the state's own green claims, the science, and the world's attention, carried carefully and kept strictly to the environmental, is the one that is both effective and just.

Saudi Arabia is a vast desert kingdom on the Red Sea, the world's greatest oil exporter, remaking itself through the largest development projects the world has seen and marketing them to that world as models of a green future — its deserts reshaped, its coasts developed, its water conjured from the sea, its promises of ten billion trees and net zero set against the flares and the footprint of an oil economy. This guide has hidden none of that, nor pretended that the flagship projects can be openly opposed, or that oil is not central, or that the space is open and the work safe, and there is no landmark victory to promise you. But the very promises the state makes to the world are a standard it can be held to; the Red Sea coral is a world treasure the state itself claims to protect; and the science of the reality can be measured against the marketing of the green. Those are the levers, and they are real: the state's own green claims, held to account; the world's coral, defended through the marine frameworks; the footprint, pressed through the net-zero pledge; and the world's attention, which an image-conscious kingdom genuinely feels. There is no open opposition in a state where resistance has met severe punishment, and no halting of the giga-projects; this guide has said so throughout, and insisted above all on the protection of anyone inside. But the coasts and corals and deserts of Saudi Arabia are worth every careful, scientific effort, the levers that run through the state's own green claims and the world's attention are real, and the patient, technical, protective work of documenting the harm, testing the promise, and defending the coral is one that those who care — in the world's science and the international community, and, with care, inside — can genuinely do, holding a great and image-conscious kingdom to the green future it has promised the world. So can you.
